<sup>1</sup> This laboratory offers commercial calibration services and field calibration service, where noted.

<sup>2</sup> Calibration and Measurement Capability Uncertainty (CMC) is the smallest uncertainty of measurement that a laboratory can achieve within its scope of accreditation when performing more or less routine calibrations of nearly ideal measurement standards or nearly ideal measuring equipment. CMCs represent expanded uncertainties expressed at approximately the 95 % level of confidence, usually using a coverage factor of  $k = 2$ . The actual measurement uncertainty of a specific calibration performed by the laboratory may be greater than the CMC due to the behavior of the customer's device and to influences from the circumstances of the specific calibration.

<sup>3</sup> Field calibration service is available for this calibration. Please note the actual measurement uncertainties achievable on a customer's site can normally be expected to be larger than the CMC found on the A2LA Scope. Allowance must be made for aspects such as the environment at the place of calibration and for other possible adverse effects such as those caused by transportation of the calibration equipment. The usual allowance for the actual uncertainty introduced by the item being calibrated, (e.g. resolution) must also be considered and this, on its own, could result in the actual measurement uncertainty achievable on a customer's site being larger than the CMC.

<sup>4</sup> In the statement of CMC,  $L$  is the numerical value of the nominal length of the device measured in inches.  $D$  is the numerical value of the nominal diameter of the device (Diameter, External and Internal); or the long diagonal (Surface Plates - Flatness) measured in inches.  $M$  is the numerical value of the nominal weight measured in Kg (Mass, Scales).  $T$  is the numerical value of the nominal torque in foot pounds.  $T$  is the numerical value of nominal temperature measured in degrees Celsius.

<sup>5</sup> The contributions from the “best existing device” are not included in the CMC claim.

<sup>6</sup> In the statement of CMC, percentages are to be read as percent of reading, unless otherwise noted.

<sup>7</sup> The type of instrument or material being calibrated is defined by the parameter. This indicates the laboratory is capable of calibrating instruments that measure or generate the values in the ranges indicated for the listed measurement parameter.

<sup>8</sup> The contributions attributed to the repeatability of the “best existing device” are not included in the CMC claim.

<sup>9</sup> The contributions attributed to the emissivity of the infrared calibrator are not included in the CMC claim.

<sup>10</sup> This scope meets A2LA’s *P112 Flexible Scope Policy*.

<sup>11</sup> The stated measured values are determined using the indicated instrument (see Comments). This capability is suitable for the calibration of the devices intended to measure or generate the measured value in the ranges indicated. CMC’s are expressed as either a specific value that covers the full range or as a percent or fraction of the reading plus a fixed floor specification.
